

Structure Plane

Interactive Design (IXD):

- When a user visits this website, they will come to the home page that will hold only relative information to avoid information overload.
- The users will have access to a fully responsive navigation bar so no matter which device they are on the site will be fully functional. The navigation bar will be placed near the top of the page and have a slightly different coloured background, so it is obvious to the user. When hovering over a navigation link there will be a slight change in colour, so the user knows they are hovering over that certain link.
- The dropdown link in the navbar named consoles will hold some of the main information on the site. Here users will be able to come and see the top exclusive games dedicated to their console of choice, the layout will be simple, and the page will flow to attract the users. The design will be repetitive to avoid a user getting confused when reading down the page. Headings will stand out compared to the text holding information about the certain game. The image displaying the game will be big and of good quality, this will attract users and make them want to try certain games they usually might not be attracted to.
- The suggestion page is where the users can interact with the website and other users. This page will be easy to use and navigate around so users who are not maybe up to scratch with using website will not have any problem. The buttons on the page will be labelled obvious so the user knows exactly what will happen if they click it, for example if the user is to click the add game button then will be redirected to a page where they can add a suggested game of their choice.
- The add game page can be accessed by navigating over to the suggested game page and clicking the add game button. Once on this page the users will be able to interact with a table with each section of the table titled appropriately so they know what information needs to be inserted. Once they are happy with the information the submit button will redirect the user back to the suggested games page and their game will have not only been added to the page but the database.
- The edit game page once again can be accessed by navigating to the suggested games page. To edit a suggested game a user should click the edit button next to one of the games they want to edit. This will yet again redirect them to the edit games page and the user can fill out and amend the information that has been posted previously.

Information Architecture:

- The website will have a simple navigation bar near the top of the page that will be fully responsive.

- This structure will allow the users to navigate round the website with ease and make it unlikely for them to get lost.
- Also by creating the structure like this if in the future I decide to add future features such as more console choices I can add them to that section of the navigation bar without disturbing the rest of the site.
